1) A camera captures images with motion blur image Formation and aquisition timing affect clarity. Capturing of the photos in Image formed through the lens through that lens It will the images and the conditions of image formation and acquisition timing effect It will be capture the clarity of the photo we can the lens will be effectly It will clear the blur of the image a camera capture the image with the motion.

2) A digital quantization converts continuous intersity roles into a limited number digital levels

continuous image intensities

↓

Continuous to image forming

↓

quantization

a) sampling determines how much optical details it affects defect detection sensitivity and that all an automated inspection system it will be the most sensitivity and all A high resolution images and it will be the detect detection influence clarity in a real time the conditions of image will be the most

b) A camera captures the image with inconsistent intensity levels and quantisation and sensing contribute to the variation and it will be the mostly it will contribute the images lacks the details it will be affected for image formation models influence clarity

7) Object detection on depend on quality of the captured image

Real objects

↓

Sensty object

↓

image aquisition

↓

correct feature

↓

incorrect feature

8) The high resolution of images forming in a the model image photos vedio will be clearity Captured picture focusy lights

Real new

↓

light

↓

lens / optical system

↓

sensor → final image

image acquisition of retiny of product in the useful images diagnotic reliability.

Potential Body

↓

imaging sensor

↓

Image acquisation

↓

good quality

↓ yes → Beter

↓ NO → difficult

6) Information can be lost when sampling is a the insufficient or quantization use flow intensity

original images

↓

sampling

↓

fewer requen; sample

↓

quantization sampling

↓

information lost

in

3) Computer time vision that the system acquisition speed quality of the time are captures the Image flow. In a real time - vision it shows the acquisition speed shows the impact of every formats of an image it will be processing efficiency that will be that will be a very realistic and impactable for the and it in a real time vision system It is the the image formation and acquisition. It gives the clarity

4) Sampling converts a contine. image into diver image pixel if different implied resolution
